## **Unit 2: Scripting**

Lesson 3: The Game cycle

Activity 3 ( 10' m	inutes): Gap te	ext
--------------------	-----------------	-----

Fill the gaps with the words you've heard in the video.

Awake and Start are two functions that are called automatically when a script is
Awake is called first, even if the script component is not enabled and is
best used for setting up any between scripts and initialisations.
Start is called after Awake, immediately before the first, but only if the
script component is This means you can use Start for anything you need
to occur when the script component is enabled.
Start and Awake are only called once in the of a script attached to a
GameObject, so you cannot repeat the Start function by disabling and re-enabling a
script.
Update it's called once per on every script that uses it. Almost anything
that needs to be changed or adjusted regularly happens here: the movement of
objects, simple timers and the detection of, for example. Note
that Update is not called on a regular timeline, if one frame takes longer to process
than the next the time between Update calls will be different.
FixedUpdate is a similar function to Update but it has a few important differences.
FixedUpdate is called on a regular timeline and will have the same time between calls.
Immediately after FixedUpdate is called, any necessary physics calculations are made.
As such anything that affects a rigidbody (meaning a physics object) should be
executed in FixedUpdate rather than Update.
