Unit 2: Scripting

Lesson 8: Cloning an object

Activity 3 (🕮	10'	minutes):	Gap	text
----------------	-----	-----------	-----	------

Fill the gaps with the words you've heard in the video.

Instantiate is a function used to	create clones of GameObje	cts, usually fro	om a prefab.
A prefab is simply a o	bject saved in the project's	assets. Once	such example
might be firing rockets from a _	Each of the rocke	ts needs to be	instantiated
in to the game world so that it c	ould be fired.		
The most basic form of Instantia	te simply takes one param	eter, the objec	t that we
wish to However, this	s means that the prefab wil	l be instantiate	ed at its
default position, which is the	of the world.		
Instead, we want to fire it like a	rocket, so it needs to appea	ar to be comin	g from the
barrel of our bazooka. For this, v	we need a slightly different	version of Inst	antiate that
takes 3 parameters: the object t	o be instantiated, a	and	to give
our new clone.			
We need to be able to affect the	e object that's created by ou	ur instantiatior	n, the clone of
the rocket. As standard, Instanti	ate returns a type called	, but i	n order to fire
our rocket we are going to cast t	that type to a Rigidbody. No	ow we can use	it and
address anything within the Rigi	dbody class, for example th	ne AddForce m	nethod.
